What is a Computer Network?

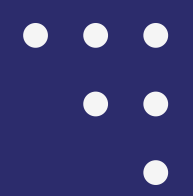

What is a Computer Network?

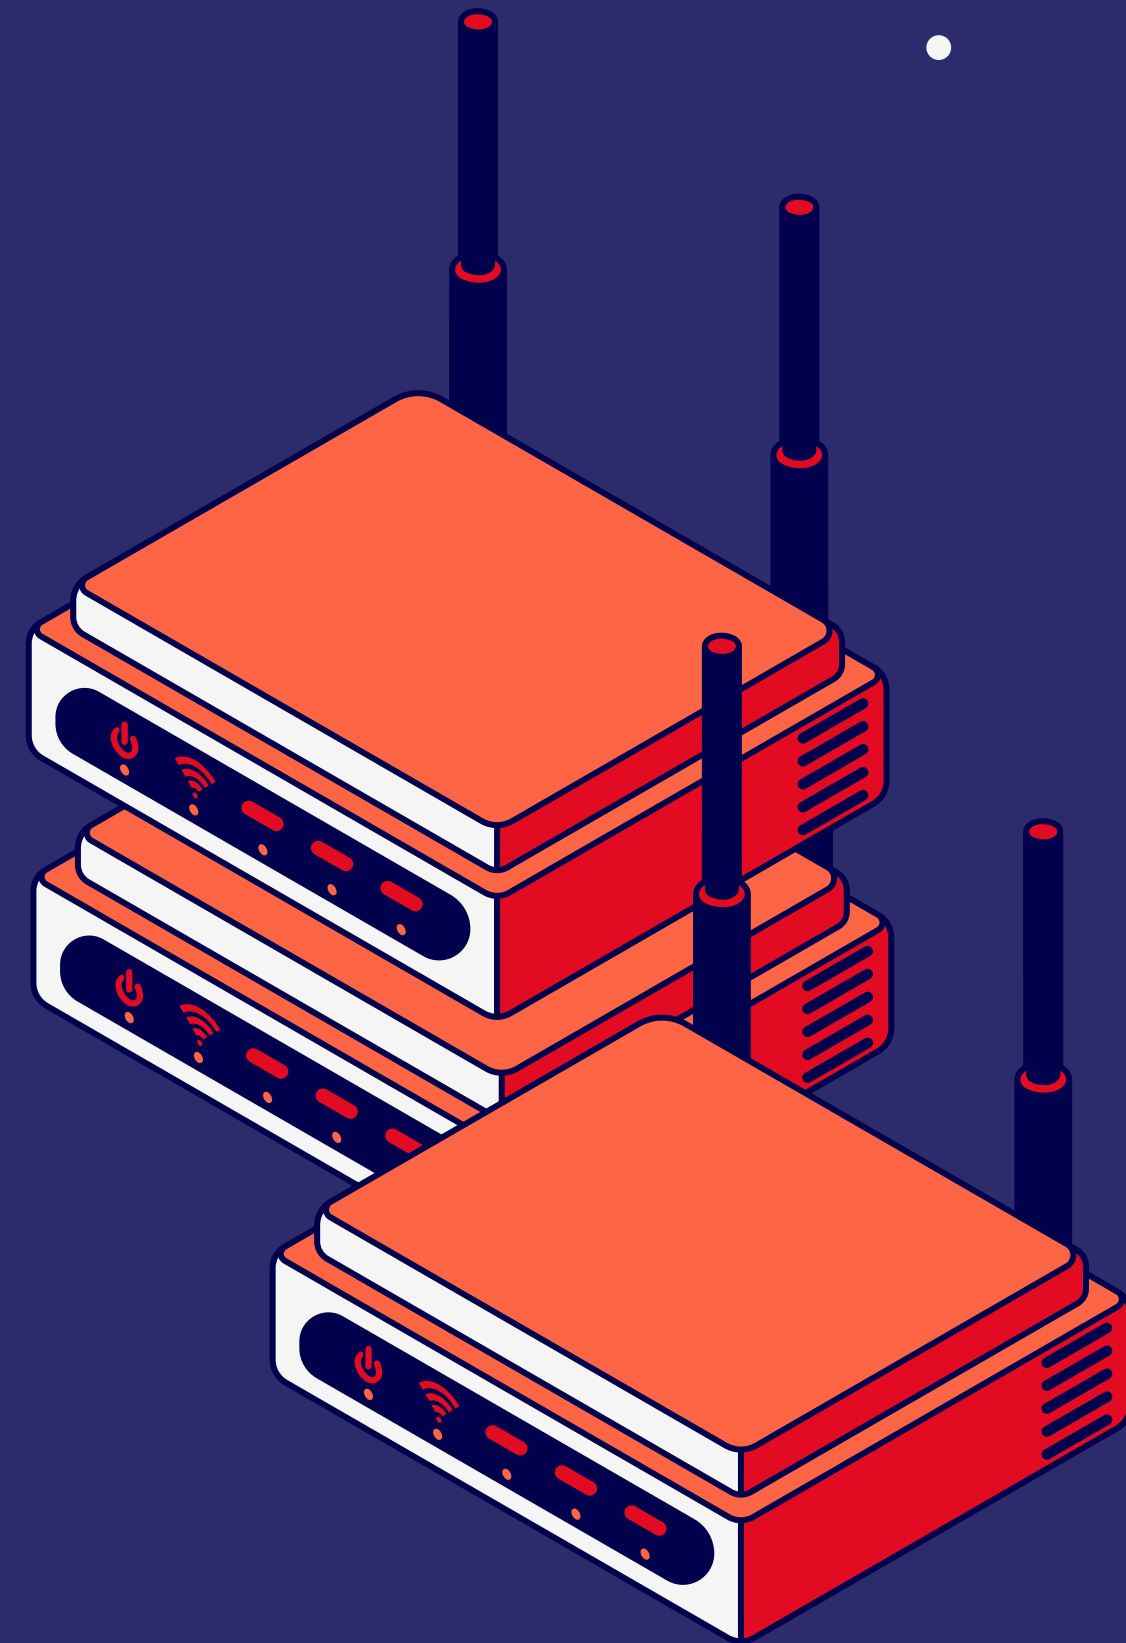

A computer network is a group of two or more computers connected together to share data, information, and devices (such as printers, internet access.).

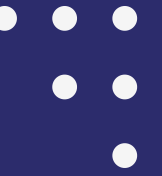

Types of Computer Networks

- ✓ LAN (Local Area Network)
- ✓ MAN (Metropolitan Area Network)
- ✓ WAN (Wide Area Network)

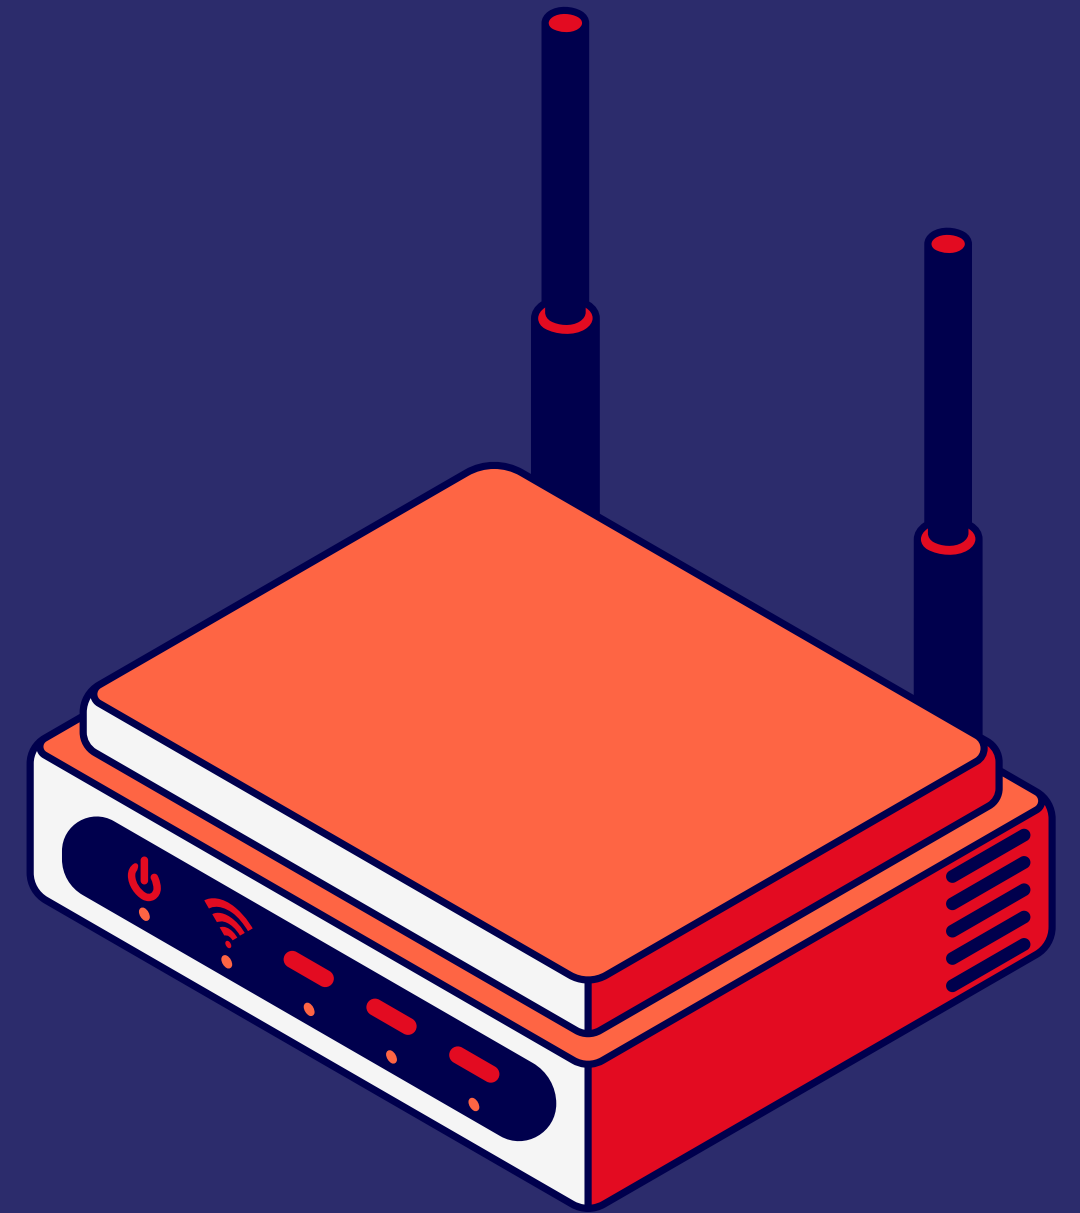

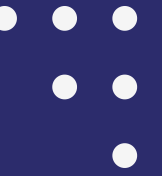

Types of Computer Networks

LAN (Local Area Network)

LAN is a computer network used to connect multiple devices within a limited area such as a home or office. An example is the network in computer lab that connects several computers to one server.

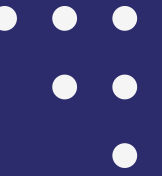

Types of Computer Networks

MAN (Metropolitan Area Network)

MAN is a computer network that covers a city area and connects multiple LANs from different offices or organizations. An example is the network connecting bank branch offices within a city.

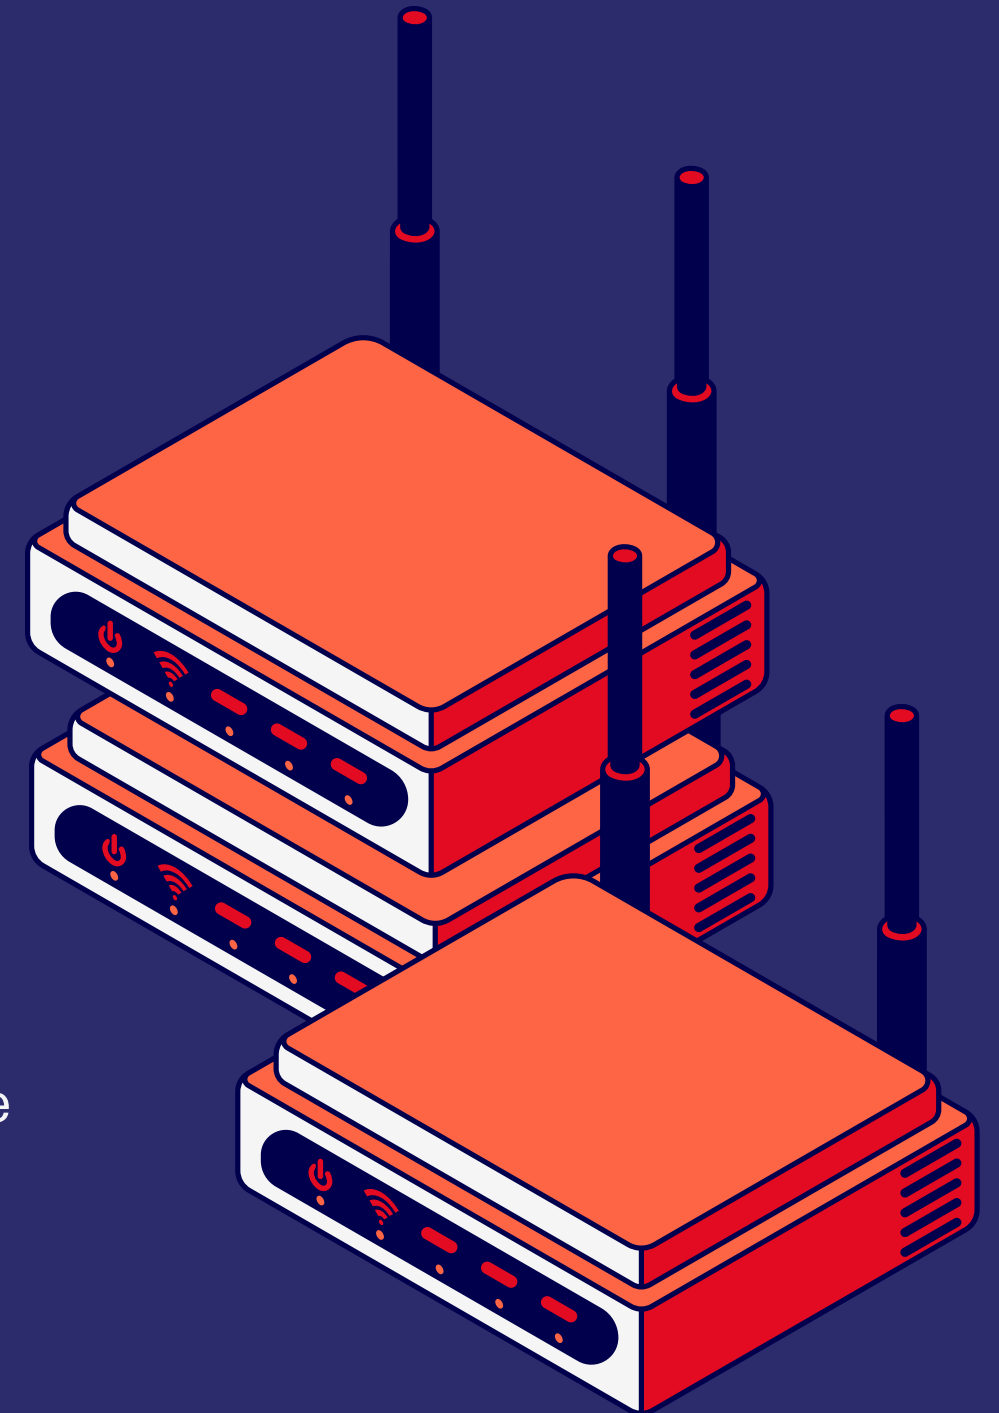

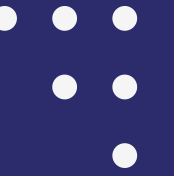

Types of Computer Networks

WAN (Wide Area Network)

WAN is a large-scale computer network that spans across cities, countries, or even continents. The most common example of WAN is the internet, which connects people all over the world.

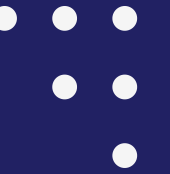

CONCLUSION

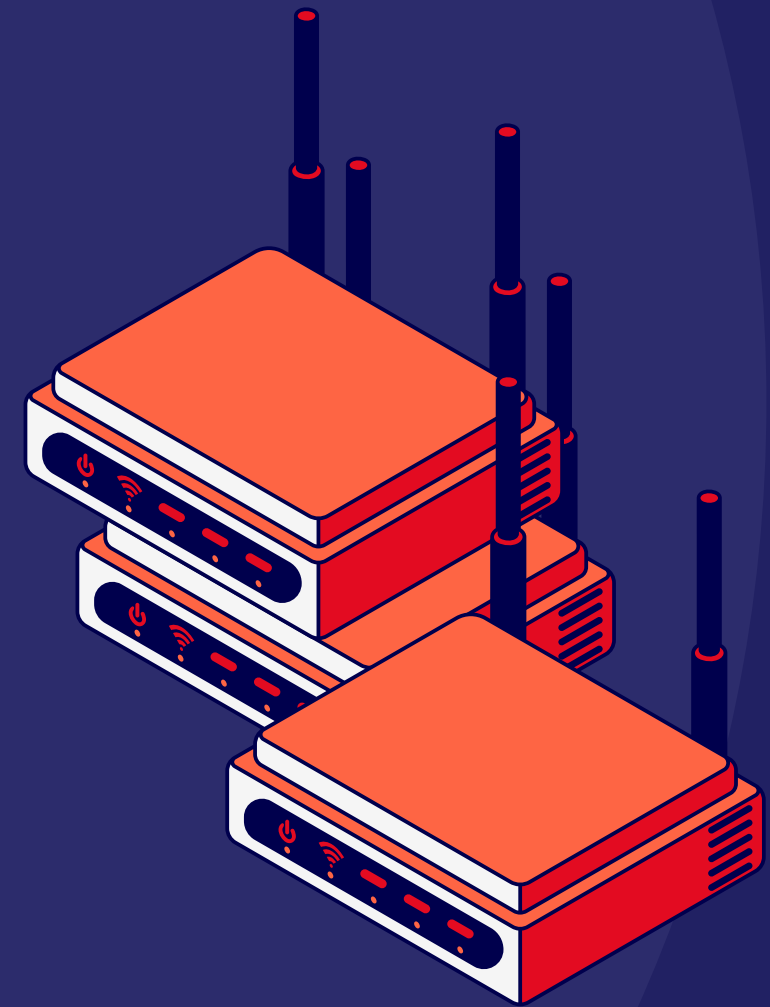

Computer networks are very useful in everyday life because they facilitate communication, sharing information, and accessing the internet.

Nowadays, the network has become one of the necessities in everyday life. A day without the internet feels like something is missing.
